derived from ORESTES PCR (U.S. Letters Patent application
No. 196,716 - Ludwig Institute for Cancer Research)
profiles into the pUC 18 vector. Reverse transcription of
tissue mRNA and CDNA amplification were performed under
low stringency conditions.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              AGENCOURT 6954504 NIH_MGC_71 Homo saplens cDNA clone IMAGE:5785846

//note=*Organ: Brain: Vector: PCRII, Invitrogen; Total RNA
was isolated from human glialblastoma cell line BT325.
Then Differential Display RT-PCR was conducted between
normal and all-trans Retinoic Acid induced cell.
Bifferentially expressed PCR products were cloned and
sequenced. "

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       9
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          80
                                                                                                                                                                                                                                   4 Human Fas cDNA variants (AAT34527-30) are derived from alternative splicing of Fas gene transcripts. They were identified following PCR amplification of cDNA derived from the peripheral blood mononuclear cells of systemic lupus erythematosus (SLE) and angloimmunoblastic lymphadenopathy (ALLD) patients and from healthy subjects. In comparison to the Fas gene (AAT34520), variant Fas del3 (AAT34529) has a deletion of nucleotides 391-637. This deletion causes frame shifting and an altered amino acid sequence (AAR99683).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       GlyTrpLeuCysLeuLeuLeuLeuProlleProLeuIleValTrpValLysArgLysGlu

chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease using the subject to a pathogen or sterile inflammatory disease using the gene expression profile; (3) detecting (M4) an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by detecting the level of expression in a sample of the tissue of gene(s) from Gs, where the level of expression of the gene is indicative of inflammation:

(4) treating (M5) an inflammation (especially chronic) or in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease, by contacting a tissue having inflammation with an agent that modulates the expression of gene(s) from Gs in the tissue. M1 is useful for detecting GA; M2 is useful for modulating GA; M3 is useful for screening an agent capable of modulating GCA preferably in an inflammation in a tissue; M4 is useful for detecting an inflammation (especially chronic) in a tissue, an allergic response in a subject, exposure of a subject to a pathogen or sterile inflammatory disease (e.g. psoriasis, rheumatoid arthritis,

It was isolated from cDNA derived from the peripheral blood mononuclear cells of systemic lupus erythematosus (SLE) and angioimmunoblastic lymphadenopathy (AILD) patients, and from healthy subjects, by PCR amplification. In addition to fascoble for PCR products were obtd. (see also AAT4527-30). These coded for soluble forms (AAR996B2-85) of Fas antigen that are present thigher levels in SLE and AILD patients than the non-soluble Fas

                   The present invention describes a method for causing apoptosis in which a fused gene consisting of a gene participating to apoptosis and a gene encoding at least the variable region of anti-idiotype antibody is transfected to a call to express the fused gene and then an idiotype antibody is reacted with the expressed cell. The method is useful in medical, pharmacoutical in paramaceutical, pharmacological and blochemical fleids. The present sequence encodes a fusion protein designated apoptobody3sc, which is used in the exemplification of the present invention.
                                                                                                                                                                                                                                                                        Apoptobody3sc fusion protein encoding nucleotide sequence SEQ ID NO:7.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               80
                                                                                                                                                                                                                                                                                                                                                                                            GlyTrpLeuCysLeuLeuLeuLeuProIleProLeuIleValTrpValLysArgLysGlu 20
                                                                      A cDNA library was prepared from polyA+ RNA from the human lymphoma cell line KT-3. The CDNA was ligated to BatxI-cut vector pCEV4 via BatxI linkers. The KT3 cDNA library was used to transfect monkey COS-7 cells which were then suspended in buffer containing murine anti-Fas Ab. The cells were panned on plates pre-coated with goat anti-mouse antibodies. The Fas-expressing cells adhered to the plates. Extrachromosomal DNA was prepared from adhered cells and used to transform E.coli VMIO0 cells. A 520bp XhoI-BamHI fragment from a positive clone (PF3) was used to screen the KT-3 cDNA library. The longest cDNA clone was designated pF58 and contains an ORE corresp.

                                                                                                                                                                                                                                                                                                          AAQ95297 is the plasmid pF58 which contains the human Fas cDNA. The plasmid was used in the construction of an expression vector for the prodn. of recombinant soluble membrane proteins. The proteins can be used in antibody prodn. for the treatment and prevention of related diseases.

The soluble Fas antigen is included in the immunoasay kit of the invention. The kit is for the assay of soluble Fas antigen and contains an immobilised anti-soluble Fas monoclonal antibody, as well as the standard soluble Fas antigen encoded by this sequence. The assay is simple and has high accuracy, high sensitivity, and is capable of assaying a number of different specimens at the same time. The immunoasay is used on biological samples (such as serum) and is useful for diagnosis of autoimmune diseases such as

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    LeuAsnProGluThrValAlalleAsnLeuSerAspValAspLeuSerLysTyrIleThr
                                                                                                 Fas antigen derivative containing modified extracellular region -
has low antigenicity, promotes apoptosis and is useful in treatment
of viral and other diseases
                                                                                                                                                                                                               The present sequence was used in the development of novel Fas antigen derivatives, which contain a Fas antigen extracellular region lacking one or more amino acid residues in the region from the amino-terminal to (but excluding) the 1st cysteine residue (preferrably at least 29 residues are deleted).

The derivatives are effective regulators of apoptosis and can be used (either by administration of the polypeptide, or by the use of the coding DNA in gene therapy) to treat a range of diseases, e.g. diabetes, arthritis, lupus and in particular viral diseases such as hepatitis, influenza and HIV, by modulating apoptosis of
                                                                                                                                                                                                                                                                                                                                                                                                                                                              Sequence 2534 BP; 817 A; 491 C; 499 G; 727 T; 0 other;

The present sequence represents a Fas cDNA sequence used in the method-of the invention. The method is concerned with reducing depletion of activated Fas-expressing CD8+ Tlymphocyte killer (TK) cells in an immune cell population which also comprises of Fas-ligand (FasL)-expressing activated CD4+ cells. It involves contacting this immune cell population with an effective amount of an agent (e.g. a soluble Fas Fc fusion protein) which would interfere with the interaction between Fas and FasL. Therefore, the method is useful for identifying suitable agents which can reduce depletion of activated Fas-expressing CD8+ TK cells in immune cell populations. Also claimed is the use of the agent in the manufacture of therapeutic compositions. Apoptosis of Immune cell populations and its ligand FasL. By interfering with this interaction, the method described and its preparations can prevent apoptosis of CD8+ TK lymphocytes caused by expression of FasL on activated CD4+ cells. Such FasL-expressing activated CD4+ cells. Such man immunodeficiency virus (HTV) or simian immunodeficiency virus e.g., human immunodeficiency virus (HTV) or simian immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  naintenance/regeneration of cytotoxic T lymphocyte (CTL) activity towards the CD4+ cells infected with the infectious agent, enabling treatment (prophylactic and/or therapeutic) of immunodeficiency
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Reducing CD8+ lymphocyte apoptosis to treat e.g. immunodeficiency diseases - by interfering with interaction of Fas with Fas-ligand expressed on activated CD4+ cells, e.g. cells infected with HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The claimed prevention of apoptosis may then allow

                                                                                                                  The present sequence encodes human Fas (Apo-1). The specification describes antisense compounds which are targeted to the 5'-untranslation, translational start site, translational termination region or 3'-untranslated region of hucleic acid molecules encoding Fas, Fas ligand (FasL), or Fap-1 (Fas associated protein 1, protein tyrosine phosphatase). The antisense compounds are used to inhibit the expression of Fas, FasL or Fapl in cells or tissues. They are used to treat autoimmume or infilammatory diseases such as hepatitis. They can also be used to treat cancer, especially colon, liver or lung
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Human; immunosuppressive; antiinflammatory; hepatotropic;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Novel antisense compound targeted to nucleic acid encoding Fas, Fas
ligand or Fas associated protein-1 is useful for inhibiting expression
of Fas, Fas ligand, or Fap-1 in cells or tissues, and for treating
hepatitis
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention relates to an antisense compound encoding Fas, Fas ingand, or Fas associated protein-1 (Fap-1). The inhibition of Fas mediated signalling is thought to be immunosuppressive, antiinflammatory, hepatotropic, cytostatic and vasotropic. Antisense oligonucleotides were designed to target human Fas. Oligonucleotides were synthesised as chimeric oligonucleotides and are useful for treating an animal having an autoimmune or inflammatory disease e.g., hepatitis, cancer, a condition associated with apoptosis, allograft rejection, or ischemia reperfusion injury. Optionally, the above mentioned conditions are prevented by contacting the allograft with the antisense oligonucleotide. The
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               oligonucleotides are used in diagnostics, therapeutics, prophylaxis and as research reagents and in kits. The oligonucleotides are also useful for research purposes. The present nucleotide sequence is
